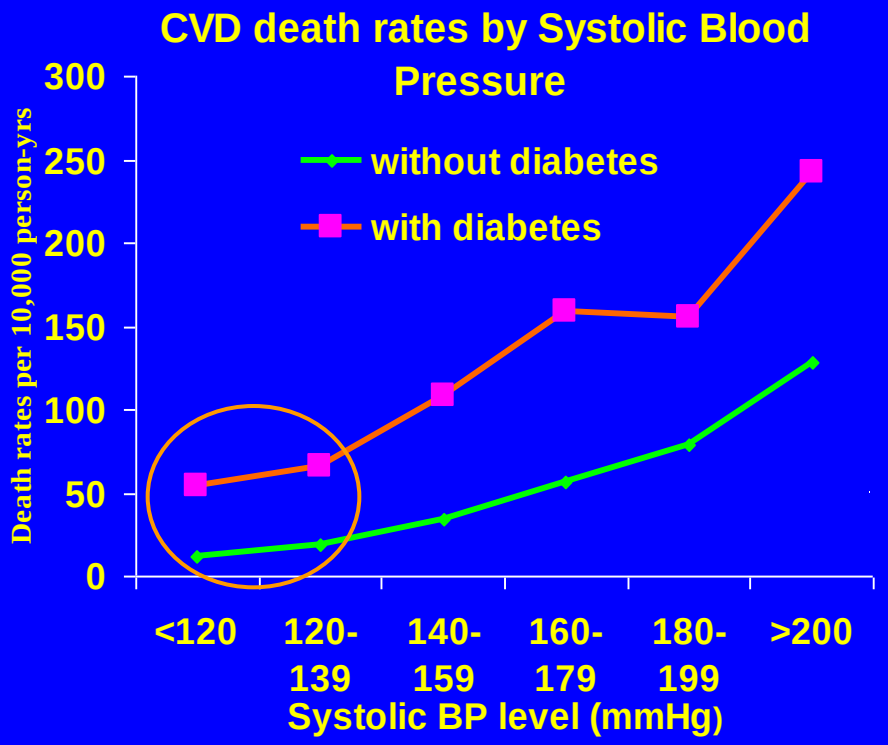
Augmentation ?

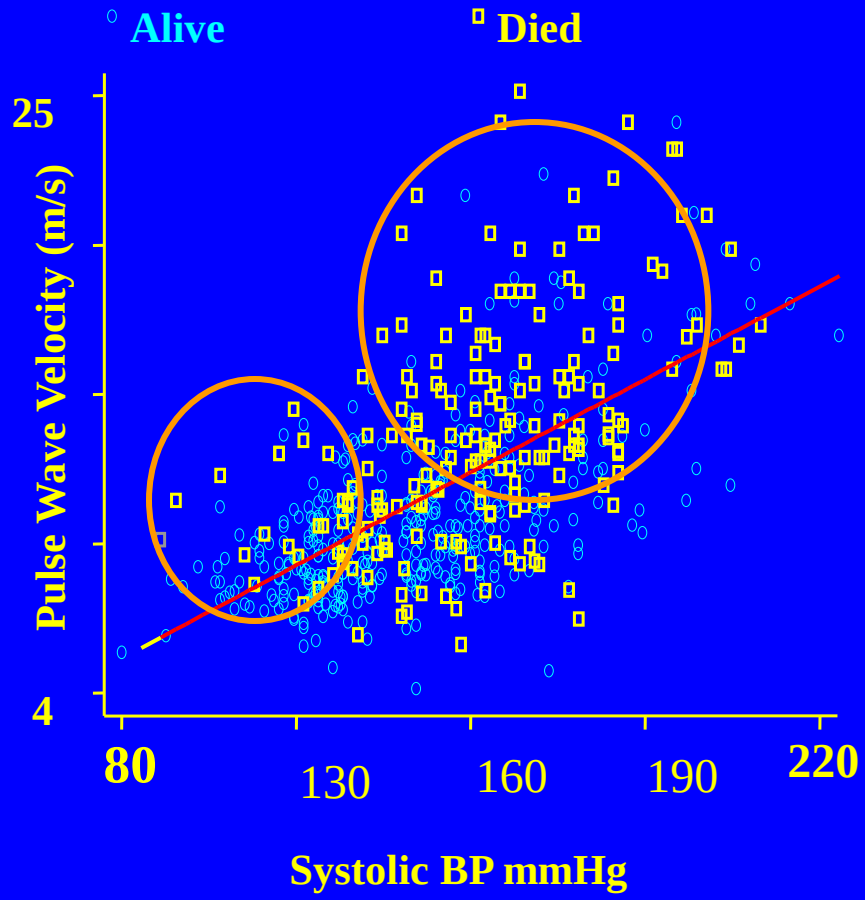
Age adjusted cardiovascular death rates with and without diabetes at screening for MRFIT



Vacarro et al 2003

NB: Accord Trial data 2010

Arterial Stiffness as Pulse Wave Velocity (PWV) vs SBP for all T2 Diabetes & GTTd Controls



Cruickshank et al Circulation 2002

Individual Patient Meta-analysis of Arterial Stiffness and Mortality – an **intermediary outcome** not a risk factor..

Table 1 Pooled Adjusted Hazard Ratios (95% CIs) of a 1-SD Increase in Log_e-Transformed aPWV for All-Cause Mortality, CVD Mortality, CHD Events, Stroke Events, and CVD Events

	Model 1*	Model 2*	Model 3*
CHD events (n = 1,195)	1.35 (1.22–1.50)	1.32 (1.18–1.48)	1.23 (1.11–1.35)
CVD events (n = 1,785)	1.45 (1.30–1.61)	1.37 (1.23–1.52)	1.30 (1.18–1.43)
Stroke events (n = 641)	1.54 (1.34–1.78)	1.37 (1.21–1.54)	1.28 (1.16–1.42)
CVD mortality (n = 395)	1.41 (1.27–1.56)	1.35 (1.20–1.53)	1.28 (1.15–1.43)
All-cause mortality (n = 2,041)	1.22 (1.16–1.27)	1.20 (1.15–1.26)	1.17 (1.11–1.22)

*Model 1 adjusts for sex and age group; model 2 adjusts for sex, age group, and systolic blood pressure; and model 3 additionally adjusts for other risk factors (cholesterol, high-density lipoprotein cholesterol, smoking status, presence of diabetes, and antihypertensive medication), stratified by race in the Sutton-Tyrell study (27). Not all studies had data on every risk factor.

aPWV = aortic pulse wave velocity; CHD = coronary heart disease; CI = confidence interval; CVD = cardiovascular disease.

The Impact of Malaria in Pregnancy on Changes in Blood Pressure in Children During Their First Year of Life

Omolola O. Ayoola, Olayemi O. Omotade, Isla Gemmell, Peter E. Clayton,* J. Kennedy Cruickshank*

Hypertension. 2014;63:167-172.

Table 3. Regression Analyses for Determinants of Change in Infant Blood Pressure

	ΔSBP			
Variable	β	95% CI	*P* Value	R^2
0–12 mo				
Sex (boy/girl)	−4.4	−7.72 to −1.08	0.01	
Malaria status	3.64	0.32 to 6.95	0.03	
Length SDS 0–3	−1.98	−3.56 to −0.40	0.014	
Weight SDS 0–3	…	…	…	
Weight SDS 0–12	2.41	0.98 to 3.84	0.001	0.10

Table 2. Comparison of Infant BP by Maternal Malaria With US BP Percentiles

	12 Mo (n=318)			
	Boys (n=173)			
BP Percentile	MP No (n=86)	%	MP Yes (n=87)	%
<90th	70	81.4	70	80.5
90th–94th	10	11.6	4	4.6
≥95th	6	7.0	13	14.9

BP indicates blood pressure; and MP, maternal malarial parasites detected.

X 2 Expected NB Temperature difference

Initial studies of Arterial function in Ghana

Factors related to PWV (arterial stiffness) in T2 Diabetes patients with (n=164) and without ‘High BP’ (n=83), in hypertensives (n= 78), & in similarly aged Controls (n=62)

	Standardised B	**P value**
Mean BP	**0.38**	**<0.001**
Age	**0.34**	**<0.001**
Hypertension status	**0.196**	**0.001**
BMI	**-0.172**	**0.001**
Diabetes status	**0.126**	**0.025**
WHR	0.035	0.4
Heart rate	0.035	0.4
FPG	0.016	0.8

‘Diagnosis’ of Hypertension

‘the level of BP above which treatment does more good than harm’
(Rose 1964)

= need Randomised Clinical Trials of TREATMENT to decide

Hypertension currently...

- >140/90 mmHg (30+% adults – BUT age-related)
- 98% Primary (essential)
- 2% Secondary: Adrenal gland tumours / *hyperplasia [?]*
- Kidney disease
- Renal artery stenosis
- Genetic disorders
- Drugs (OCP) Liquorice

Candidate genes screened for linkage to (high) BP in African-Americans, Caribbeans and west Africans:

- Epith. Na+ channel
- TGF- B
- Endothelin-1, Naturetic peptides
- a- receptors
- Glyc389 B1 Rc
- Aldosterone synthase
- NO synthase
- Angiotensinogen etc.

All linked, & not found on repeat sampling in other data.

cf. UK MRC's 'BRIGHT' study

Sick genes, Sick individuals or Sick populations with chronic disease? An example from studying diabetes & hypertension in African-origin populations.

What it's all about is

regulation of gene expression

—

not the genome itself

Primary Hyperaldosteronism

(Kaplan NM: In Kaplan's Clinical Hypertension 2002)

= Conn's syndrome

- Low Prevalence (1-2% of unselected hypertensives)

30% caused by adrenal adenoma

- **70% adrenal hyperplasia**
- V. rarely adrenal carcinoma
- glucocorticoid suppressible aldosteronism (autosomal dominant)

- Adenomata commoner in women (rare in children)

Adrenal enlargement

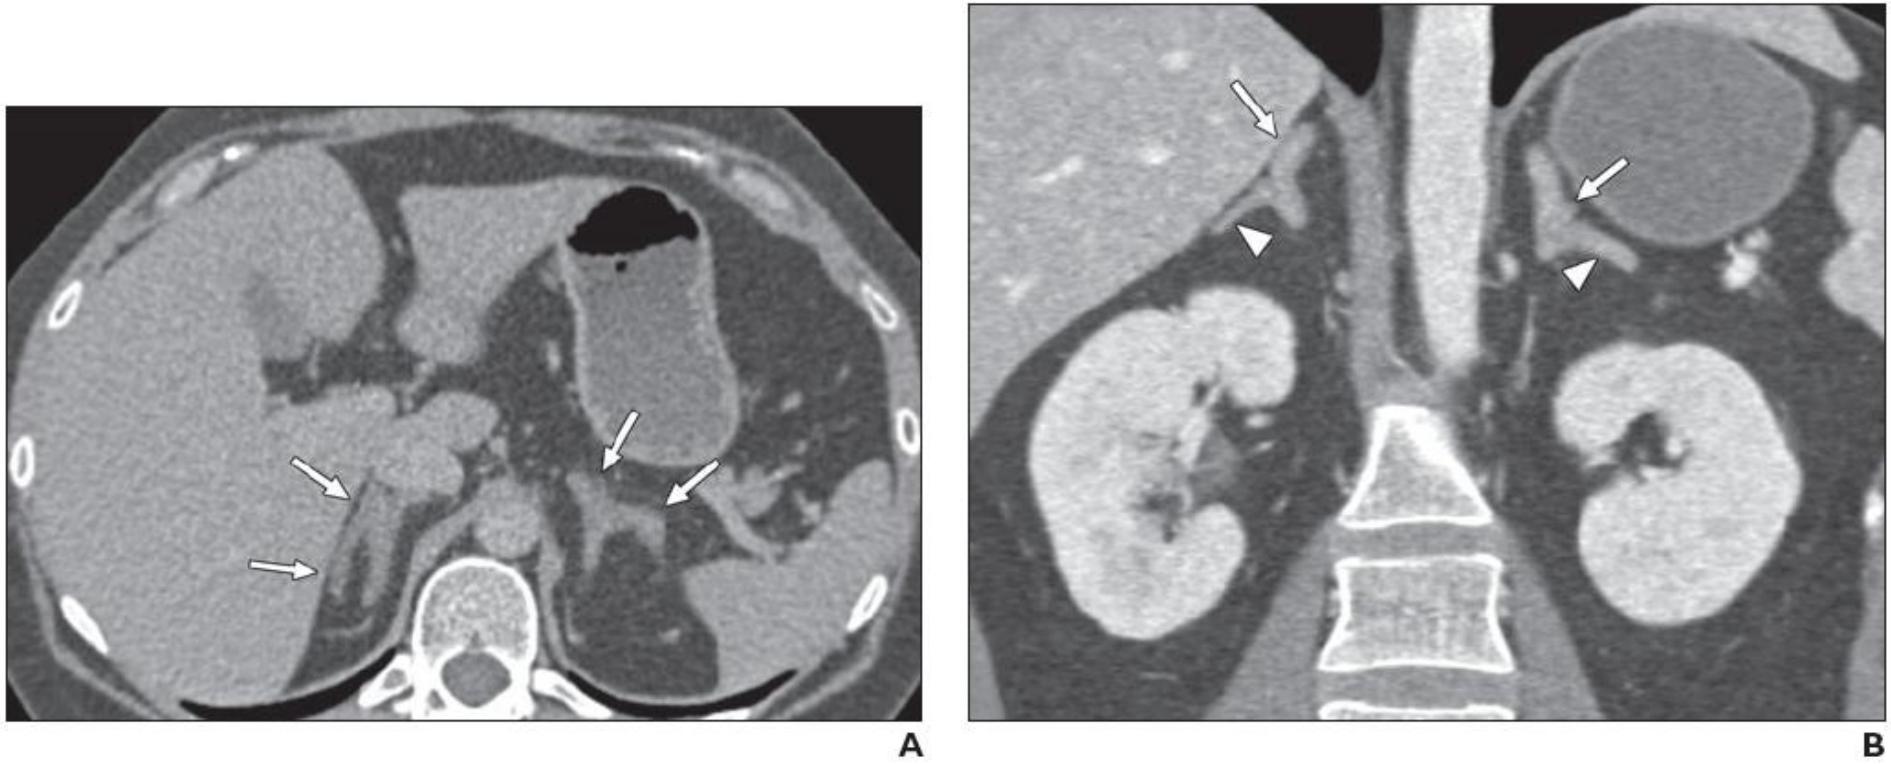

Fig. 2—27-year-old woman with history of Cushing's disease.
A and **B**, Axial unenhanced CT image (**A**) and coronal contrast-enhanced multiplanar reformation (**B**) show bilateral adrenal enlargement (*arrows*) and mild asymmetry of lateral limbs (*arrowheads*, **B**).

'Normal' adrenal 'limbs' <5mm

Summary

- Arterial function a genuine candidate beyond high BP
- Think ‘life-course’ not just ‘adults’
- Gene variants *not* seriously implicated for the great majority of HIGH BP
- Aldosteronism.. Moving forwards..?! –

  - still not common but..

Navigating the shoals in hypertension: discovery and guidance

Despite the extensive evidence underpinning treatment of high blood pressure, important questions remain. **Morris Brown**, **Kennedy Cruickshank**, and **Thomas MacDonald** argue that assumptions in recent treatment guidelines are based on insufficient evidence
